We choose to select object relational data base cause of the following reasons:

- Our application is kind of transaction processing. Our application is designed to process a lot of requests for surgeries.
- Surgery, doctor and user information are exposed to change by a large number of users. So our data base should update permanently.
- Data base can simply expanded by adding new tables.
- We are familiar to object relational database.
- Data base schema is simple to understand.

So we choose ORDBMS(SQL) ☺
